Gira Project Assistent GPA

The GPA from version 5 works with individual databases per GPA project. The connection to the PM projects was realized via the project name. The project name of the PM project must be included in the GPA project name.

Create:

Create a new project in the desired GPA version and observe the naming rules as described in the next point "Import".

Inventory data import:

There is no direct import. Create a new project of the type "GPA" in the PM and transfer the name to the GPA project that you want to link to the PM. It is possible that the GPA project name is extended. For example, PM project "Schneider, Frankfurt" can be named "Schneider, Frankfurt (1)" or "Schneider, Frankfurt Backup 24-12-01" in the GPA. There may also be several GPA projects that contain the PM project name.

Edit:

Double-click to automatically start the correct GPA in the required version. If this is not installed, you will receive a corresponding message. After installing a new GPA version, you must restart the PM so that this version is available. If you want to edit the project in a newer version, simply start the newer GPA manually and edit the project. The PM will recognize this and take it into account in future.

Check in/out:

If you check in the PM project with the type "GPA", the system checks which GPA projects exist and contain the name. All corresponding projects are moved to the PM project and then checked in. The GPA is therefore tidy and clearly organized.

Combined project type:

ETS projects can also be attached to this project type.
